Acknowledgments
The Science of Food educational materials, first developed as part of the My Health My World® project at Baylor College of Medicine, have benefited from the vision and expertise of scientists and educators from a wide range of specialties. Our heartfelt appreciation goes to Michael Lieberman, M.D., Ph.D., William A. Thomson, Ph.D., and Carlos Vallbona, M.D., who have lent their support and expertise to the project.

Special acknowledgment is due to our partners in this project, American Physiological Society (APS) and the Texas Medical Association. We especially thank Marsha Lakes Matyas, Ph.D., and Katie Frampton for their invaluable direction of field testing and dissemination activities in the Washington, D.C. area.

We are indebted to the Science Education Partnership Award Program of the NCRR and to L. Tony Beck, Ph.D., for supporting the development and field testing of this unit. We also thank the National Institute of Environmental Health Sciences, Allen Denny, Ph.D., Frederick Tyson, Ph.D., and Liam O’Fallon for their support and expertise in the Washington, D.C. area.

We are especially grateful to the many classroom teachers in Washington, D.C., and Houston, Texas, who field tested these materials and provided invaluable feedback.
Food affects health and well-being in two important ways. First, we require appropriate amounts of different kinds of foods to supply the energy and nutrients we need for daily activities and for growth and maintenance of our bodies. Second, food can contain contaminants that can make us sick.

Carbohydrates, fats and proteins are our main sources of energy. Our bodies also need protein to maintain muscles and carry out many functions inside cells. Small amounts of vitamins and minerals also are necessary.

Food becomes available for use by the body through the process of digestion. Digestion breaks down large food molecules into smaller ones that can be transported and used by the body.

Many Americans eat too much refined sugar and unhealthy fats. Examples of foods with little nutritional value, or with too many added calories, are soft drinks, chips, greasy fried foods, candy and snack cakes. A diet that has a lot of “junk” foods is harmful in two ways. First, it does not provide all of the vitamins, minerals and other substances needed for growth and health. Second, a diet with many sweets and fatty foods often delivers too many calories. When a person eats more calories than he or she uses up through movement and exercise, the body stores the excess energy as fat. Excess body weight can contribute to a number of serious health problems, such as type 2 diabetes, heart disease and stroke.

How foods are grown and prepared also is important. Plants and animals can take in small amounts of pollutants (harmful chemicals) from water, food or soil. These pollutants can accumulate in the bodies of other living organisms that eat the smaller plants or animals—a process known as bioaccumulation. Food also can be spoiled by bacteria. Most bacteria that cause food-related illnesses are spread because hands and food preparation areas are not kept clean or because food is not kept at the proper temperature.

Simple actions, such as washing hands before eating or preparing food, help to reduce the possibility of spreading bacteria or other harmful substances to food.

CHILDREN’S ENVIRONMENTAL HEALTH
Children are particularly susceptible to contaminants in food and in the environment. Because their bodies are still growing and because they eat more fruits and vegetables (which may contain chemical residues) relative to their body weights, children are more vulnerable to the harmful effects of substances such as lead and pesticides. However, many researchers believe that a healthy diet, which provides recommended amounts of vitamins and minerals, may help protect children from potentially harmful chemicals.

AVOIDING SUGARY DRINKS
Many soft drinks have around 10 teaspoons of sugar in a 12-ounce can. These drinks, which have little nutritional value, contribute to the nationwide epidemic of overweight and obesity.
Beginning in 1994, the US Government began requiring manufacturers to put information about nutritional value on food labels. This information helps people make better choices about which foods to buy and eat. All food labels must present the same basic information in a standard format. This information includes, at minimum, the amount per serving of saturated fat, cholesterol, dietary fiber, and other nutrients known to be important for health. Labels also provide nutrient reference values, expressed as “% Daily Values,” to help consumers see how a food fits into an overall daily diet. It is important to pay attention to the serving sizes on any food label. Packages also must list all ingredients in foods. This list is given in order, by weight, beginning with the ingredient that weighs the most. This information can be helpful when selecting foods.

- **Carbohydrates** are the body’s main source of fuel. Starchy foods like breads, spaghetti, rice, potatoes, corn and cereals are made up mostly of carbohydrates. Sweet foods like candy, jam and syrups also are carbohydrates. Some carbohydrates, called fiber or roughage, are hard to digest. They help move waste through the digestive system.
- **Fats** include butter, margarine, lard, shortening and cooking oils. Meats, cheese, cream, chocolate and many desserts like cakes and cookies usually have a lot of fat. Fats are very concentrated sources of energy. Some kinds of fat (particularly fats that are solid at room temperature) have been linked to diseases of the heart and circulatory system. Most Americans eat too many high-fat foods.
- **Proteins** are important for growth and repair of the body. Protein-rich foods include eggs, milk products, meat, dried beans, chicken, turkey and fish. The body also uses protein as fuel to provide energy for movement and growth.
- **Minerals** are found in small amounts in foods. They are needed for many of the body’s functions. For example, calcium is used to build bones and teeth and also is important for muscles and the nervous system. Iron goes into making red blood cells.
- **Vitamins** are other chemicals found naturally in food that are needed in very small amounts by the body. Fruits and vegetables are valuable sources of vitamins and minerals. All foods also contain some water.
SETUP
Have students work in groups of 2–4. Set up sugar and other materials in a central location.

PROCEDURE
1. Remind students of the food guides they used at the beginning of this unit. Ask, How can we be sure that the foods we eat each day contain the nutrients we need?
2. Mention that packaged foods now have uniform labels that provide information about the nutritional value of foods. Distribute copies of the student page.
3. Have students read the label depicted on the student page out loud in their groups. Follow by helping them understand the concepts outlined in the box above.
4. Ask students, What units of measure are mentioned on the label? (cups and grams). Mention that they will be investigating these measures using sugar.
5. Have students, in their groups, follow the instructions on the Sugar Measures Up page. They will explore how much sugar is contained in a typical soft drink.
6. Afterwards, ask, Were you surprised about the amount of sugar in one soft drink? How many soft drinks would you need to meet your daily total carbohydrate requirement? Do you think that that would be a good way to fuel your body?
From the Label to the Table!

Pay close attention to serving sizes.

Look for foods with lower levels of saturated fats.

This tells you how much salt is in food.

Calcium is important for bones and teeth.

Use this section as a guide for daily planning.

The amount of calories a person needs each day depends on many factors, including exercise.

Products labeled “light” or “lite” must have 1/3 fewer calories or 1/2 the fat of the foods to which they are compared. “Light” also can mean that salt has been reduced by 1/2.

Look for products that have more fiber and less sugar.

Vitamins and minerals help your body function properly.

VITAMINS AND MINERALS

- **Vitamin A**: Important for vision, growth, reproduction, and immune function. (Recommended daily intake: 800-2,000 IU for adults)
- **Vitamin C**: Important for immune function and wound healing. (Recommended daily intake: 75-90 mg for adults)
- **Calcium**: Important for bones and teeth. (Recommended daily intake: 1,000-1,200 mg for adults)
- **Iron**: Important for oxygen transport in blood. (Recommended daily intake: 8-18 mg for adult women, 8-11 mg for adult men)

USING FOOD LABELS
Environment and Health
¡De la Etiqueta a la Mesa!

Presta atención al tamaño de las porciones.

Busca alimentos con niveles bajos en grasas saturadas.

 Esto te dice cuánta sal hay en la comida.

El calcio es importante para los huesos y los dientes.

Usa esta sección como guía para planear tus alimentos diariamente.

La cantidad de calorias que una persona necesita diariamente depende de varios factores, incluyendo el hacer ejercicio.

Los productos que son etiquetados “light” o “lite” deben tener 1/3 de las calorías menos o de las grasas menos que los alimentos con que están siendo comparados. “Light” también quiere decir que la sal ha sido reducida a la mitad (1/2).

Busca productos que tengan más fibra y menos azúcar.

Las vitaminas y los minerales ayudan a tu cuerpo a funcionar apropiadamente.

Sugar Measures Up

You will need a measuring cup, a teaspoon, and sugar.

1. Think about an ordinary can of your favorite soft drink. The can holds 12 ounces of liquid. How many teaspoons of dissolved sugar do you think is in one can of soft drink?

2. On the measuring cup to the right, draw a line to show the amount of sugar you predict is in one can of soft drink.

3. Now, use the following information to answer the question below.

   An average soft drink contains about 40 grams of sugar.

   One teaspoon of sugar weighs 4 grams.

   How many teaspoons of sugar are in a can of soft drink?

4. Put that many teaspoons of sugar into the measuring cup.

5. Look at the amount of sugar actually in your measuring cup. On the measuring cup to the right, draw a line showing the actual amount of sugar in a can of your favorite soft drink.
Midamos el Azúcar

Necesitas una taza de medir, una cucharita y azúcar.

1. Piensa sobre una lata de tu refresco favorito. Esta lata tiene 12 onzas de líquido. ¿Cuántas cucharaditas de azúcar disuelta tú crees que hay en una lata de refresco?

2. En la taza de medir que ves a la derecha, dibuja la cantidad de azúcar que tú predices hay en una lata de refresco.

3. Ahora, usa la siguiente información para contestar la pregunta que verás a continuación.

   Una lata de refresco promedio contiene alrededor de 40 gramos de azúcar.

   Una cucharadita de azúcar pesa 4 gramos.

   ¿Cuántas cucharaditas de azúcar hay en una lata de refresco?

4. Echa esta cantidad de cucharaditas de azúcar en la taza de medir.

5. Mira la cantidad de azúcar que hay en la taza de medir. En la taza de medir a tu derecha, dibuja la cantidad actual de azúcar que hay en una lata de tu refresco favorito.
